Assignment 11

Sachin Shubham

4/10/2021

Task 1:

Work with the project data. Build a regression model based on the article level data which is predicting the cross-disciplinary in CIP (XCIPp variable) Classification of Instructional Programs, using year of publication, log-transformed coauthors count, log-transformed Major MeSH count, regions count and total number of SAps (NSAp) as predictors. Get model summary, pseudo r-squared measures, odds ratio and comment about the results.

Solution:

```
library(tidyverse)
## -- Attaching packages ----- tidyverse
1.3.0 --
## v ggplot2 3.3.3 v purrr 0.3.4
## v tibble 3.0.5 v dplyr 1.0.3

Conclusion:

The summary of the model shows that:

- 1. All of the variables are highly significant in predicting cross-disciplinary in CIP with all p-values are quite less than 0.05. The number of co-authors and region the article was written appear to also have a close standard error.
- 2. As we know that values of pseudo r-squared [ρ 2] between 0.2 to 0.4 represent an excellent fit.Our model pseudo r-squared [ρ 2] is 0.2282903, which represent our model is excellent fit.
- 3. The odds ratio shows that from the data given, the region from where the article research took place was 7.33 times more successful in predicting whether the article had cross-disciplinary co-authors. The log number of co-authors was also successful in predicting whether the article had cross-disciplinary co-authors with a success-to-failure ratio of 1.85. All variables in the odds ratio were shown to be extremely significant.
